THE GITHUB LINK + THE SETUP, IN ORDER

How to set up Harvey, the Claude agent that *finds you clients*

The link, what you really need, the one-sentence setup, your first run and the rules before you send. Checked on Harvey's own repo, 25 Oct 2026.

NO API KEY · NO API BILL · MIT LICENCE

THE LINK

Harvey

instead of ~~lead tools at $250–500/mo~~ → **$0**

An open-source sales agent that runs on your **Claude Pro or Max** plan through Claude Code. It finds businesses that fit what you sell, reads their websites, writes each one a personal cold email and works the replies toward a meeting.

FREE LIMIT	No API key and no per-token bill: model calls use your Claude plan. Harvey caps itself at 80 % of your daily usage, and nothing is sent until you approve it.
RUNS ON	Your own computer (Mac, Linux or Windows with Claude), in a loop every 15 minutes. You need your own mailbox to send from.
PAID STILL WINS	Big companies and huge contact lists. Harvey is strongest on small local businesses, read from their own websites.
CLIENT WORK	MIT, made by Ethan+ (ethanplusai on GitHub).

START IN 3 STEPS

1. Open the repo and read the first screen of the README.
2. Follow "Setup in one sentence" on the next page.
3. Keep approval on for your first batch.

Quick start ↗
github.com

BEFORE YOU START

What you *need*

THE HONEST COST LIST

CLAUDE PRO OR MAX	the plan you already pay for, logged in to Claude Code (`claude login`)
PYTHON 3.11+	free. On a Mac: `brew install python@3.13` (macOS ships 3.9)
A MAILBOX	Gmail / Google Workspace (~$7 a month) or Microsoft 365, ideally on a separate sending domain
FINDING BUSINESSES	$0 on the default source (OpenStreetMap). Paid sources are optional, from ~$0.37 per 1,000
READING THEIR SITES	$0: three web requests each, no AI call

SO IS IT FREE?

The **code** is free and open source, and there's **no API bill**. You still need a Claude plan and a mailbox. Everything else is optional.

THE EASY WAY

Setup in *one sentence*

COPY THIS PROMPT

```
git clone https://github.com/ethanplusai/harvey.git
cd harvey
claude
```

Claude Code opens inside the Harvey folder. Then type this one sentence:

COPY THIS PROMPT

```
set up Harvey for me
```

WHAT HAPPENS

The repo ships a CLAUDE.md that turns Claude Code into the setup wizard. It checks what's installed, installs what's missing, asks what it needs (your website, your mailbox) and trains Harvey on your product.

OR BY HAND

Six commands

COPY THIS PROMPT

```
python3.13 -m venv .venv && source .venv/bin/activate && pip
install -e .
cp .env.example .env
harvey train https://your-site.com
harvey signals --confirm free
harvey discover
harvey dashboard
harvey run
```

WHAT EACH ONE DOES

INSTALL	a Python 3.13 environment with Harvey in it
.ENV	add your mail provider; every line says where to get it
TRAIN	reads your site: what you sell, who you sell to
SIGNALS	turns on the 26 free facts that make an email personal
DISCOVER	finds businesses (free source, no account)
DASHBOARD	prints a private link to 127.0.0.1:5555
RUN	the loop: every 15 minutes

DAY ONE

Your *first run*

1 Train it on your real site

`harvey train` writes what you sell and who you sell to. Fix anything it got wrong before you go on.

2 Pick the signals

The facts that make an email personal: no online booking, running Google Ads, the agency in their footer, a role they're hiring for. Start with the free ones.

3 Estimate before you pay

`harvey discover --estimate` shows what a paid source would cost before it spends anything.

4 Read the first batch in the Outbox

Every email waits for you: **A** approve, **R** reject, **E** edit. Keep approval on until you trust what it writes.

STOP EVERYTHING

Type **harvey sending pause** in the terminal: it stops all sending at once, even mid-cycle.

READ THIS FIRST

Before you send a single email

- **You are the sender.** Every cold email ends with an opt-out line. Set your postal address (`compliance.postal_address`) before your first campaign; Harvey adds both.
- **EU / UK:** business cold email needs a real reason that person would care (legitimate interest). If you can't say why, don't send.
- **If someone asks "is this AI?"**, Harvey says yes. Leave that setting alone.
- **Warm up first.** A new sending domain needs SPF, DKIM and DMARC (`harvey warmup` checks them), then 2–4 weeks at 10–20 emails a day, adding about 5 a day.
- **Watch bounces.** Above about 3 %, stop and clean the list. Harvey trips its own kill switch past your limit.

NOT LEGAL ADVICE

Sending at volume or into regulated industries? Ask a lawyer where you live.

STUCK?

If something *breaks*

`COMMAND NOT FOUND: HARVEY`	run `source .venv/bin/activate` first
ODD ERRORS AFTER INSTALL (MAC)	your venv is Python 3.9: rebuild it with `python3.13`
DISCOVERY FINDS NOTHING	confirm signals first; `harvey discover --providers` lists other sources
CLAUDE CALLS FAIL	`claude login`, then `claude update`; `harvey status --check` tests it
EMAILS LAND IN SPAM	almost always the domain: check SPF / DKIM / DMARC, halve your volume
