4 CASE FILES · MUSE · DOTS · GROK BOT · CLAUDE DUET

The AI agent *privacy checklist*

They keep a file on you, so I opened one on each of them: what each agent reads, trains on and remembers, and the exact setting to change, from each maker's own help pages.

CHECKED ON THE OFFICIAL PAGES · 22 OCT 2026

BEFORE YOU CONNECT ANYTHING

Six questions, *four agents*

To message you first, an agent has to read your apps first. I asked the same six questions of each one, and answered them only from the maker's own help pages.

READS	What can it open: your inbox, calendar, files, your own computer? What's on by default?
TRAINS	Do your chats and its work train the company's AI? Where is the switch?
REMEMBERS	What does it keep, can you see it, and what stays after you delete?
ASKS FIRST	Which actions wait for your OK, and can you make it stricter?
OFF SWITCH	How do you disconnect an app, stop it, or wipe it?
WATCH IT	Can you see what it's doing, or take over?

Menus move. Every path here was checked on 22 Oct 2026; if your screen differs, the official page linked at the end has the latest.

MUSE · META

Muse trains on you *by default*

US and Canada only, 18+. Free with a usage limit.

READS	Facebook, Instagram and Threads connect **automatically** if they share an Accounts Center with Muse. Gmail, calendar and other apps only if you add them. On a Mac you choose per app: **Off**, **Read only** or **Read and interact**.
TRAINS	**On from your first chat.** Settings → Data controls → **Help improve our AI models** → off → Turn off. Meta says the change "also applies to previous interactions".
REMEMBERS	Your chats, files and a **Memory.md** you can read and edit: Assistant icon → Identity → Memory. Meta warns it "may still remember" what you delete.
ASKS FIRST	Settings → Permissions → **Always ask** (it asks before any action). Avoid "Always allow" on email.
OFF SWITCH	Settings → Connectors to disconnect. **Reset Muse** (Settings → Data controls) deletes everything and can't be undone.
WATCH IT	Yes: **Open browser**, **Take control**, **Stop the task**, and an Activity log of what it did.

DOTS · OPENAI, INSIDE CHATGPT

dots keeps *its own notes*

ChatGPT Pro (from $100 a month), most countries except the EEA, Switzerland and the UK.

READS	The apps you connect in ChatGPT, with the same permissions (you can allow **read email without send**). Access to your own computer **starts turned off**.
TRAINS	Settings → Data controls → **Improve the model for everyone** → off (on phone: profile icon → Settings → Data controls). Affects new chats. OpenAI doesn't train directly on its background research. Human review can still happen with this off.
REMEMBERS	Its own notes, plus your ChatGPT memory. Turning off ChatGPT memory **doesn't wipe** what it already has, and you **can't view or edit** its notes one by one.
ASKS FIRST	Settings → Personalization → **Custom rules**: take action, ask first, or hand off to you. Password changes and money transfers always come back to you.
OFF SWITCH	Its profile → ••• → **Pause**. Its profile → ••• → **Reset** deletes its chats, memories and schedules. Disconnecting an app doesn't delete what it learned.
WATCH IT	Yes: open its computer, **Take over**, and **Activity** in the desktop app.

GROK BOT · XAI (NOW SPACEXSI)

All your Bots share *one computer*

From $30 a month, or included with paid Cursor plans. Its data settings live in your **Cursor** account.

READS	Every app you connect works for **every** Bot. All Bots share one cloud computer: files, browser sessions, logins. Your own computer: Settings → General → Bot → Execution on Local Computer, default **Ask every time**.
TRAINS	Follows your **Cursor** privacy settings (Cursor dashboard → Settings → Privacy). Grok Bot doesn't support Legacy Privacy Mode.
REMEMBERS	Preferences, facts and work summaries. No memory viewer is documented; correct it in chat.
ASKS FIRST	Settings → General → Auto-review → add **Ask first** rules (they win over Allow rules). **Keep drafts on**: "Disable drafts" lets a Bot send email and Slack directly. Approvals from unattended runs expire in about 10 minutes.
OFF SWITCH	Per Bot: Notifications. Send "Stop now". Deleting a Bot can leave files and logins: sign out of sites, uninstall connectors, clear /workspace. A full wipe = delete your Cursor account (gone within 30 days).
WATCH IT	Yes: a live preview of the shared computer, **Take control**, and the chat shows every tool it used.

CLAUDE DUET · ANTHROPIC

You can't *watch* Duet work

A US-only research preview, by waitlist, on Claude Pro and Max.

READS	The connectors you've set up in Claude (Gmail, Calendar, Drive, Slack and more) and your past Claude chats. **Not** the files on your computer.
TRAINS	No Duet-only switch: it "uses your Claude account settings". Yours: Settings → Privacy → **Help Improve our AI models**. Claude doesn't train on raw connector content.
REMEMBERS	It uses and adds to your Claude memory. Settings → **Memory** shows every memory: read, edit or delete each one. Deleting a chat **doesn't** delete memories made from it.
ASKS FIRST	It shows you the exact action before it sends, pays, signs or deletes anything. Trading and moving money are off limits even if you approve.
OFF SWITCH	Settings → Memory → **Search and reference chats** off stops it reading old chats. Customize → Connectors to disconnect (what it already learned stays in memory).
WATCH IT	No live view or take-over of its browser. The **Tasks** tab shows what it's working on and what needs you.

ALL FOUR

Delete doesn't mean *forgotten*

Disconnecting an app stops new reading. What the agent already learned usually stays. Here's what each wipe really removes.

MUSE	Deleting a message or file: it "may still remember" what it learned. **Reset Muse** deletes everything. Turning training off also covers past chats.
DOTS	Disconnecting an app keeps what it learned. **Reset** deletes its chats, memories and schedules, but not the files, Codex threads or ChatGPT chats it created.
GROK BOT	Deleting a Bot removes its chat and routines; files and logins on the shared computer can stay. Clean them up, or delete the Cursor account.
CLAUDE DUET	Deleting a chat removes it from search, not the memories made from it. Delete those one by one in Settings → Memory, or Reset memory.

Switches change what's used from now on. Anthropic says data already used in training stays in those models; Muse is the one whose switch also covers your past chats.

FREELANCERS

Your *clients* are in there too

Connect an inbox and every person in it comes along. Meta's own words: "information about you may be provided to Muse, even if you don't use Muse directly."

MY RULE	Ask a client before you connect an inbox or drive that holds their work.
READ-ONLY	Where it's offered: Muse connectors can be read-only; ChatGPT app permissions can allow reading email without sending.
BYSTANDERS	Meta has a page for people who don't use Muse. OpenAI takes privacy requests at its Privacy Portal or dsar@openai.com, even without an account.
NEVER PASTE	Passwords or ID numbers into a chat. Each agent has a secure sign-in that keeps your password away from the AI.

BONUS

Ask it what it *remembers*

Paste this into any assistant with memory. Answers differ, and a dot can't show you its own notes, so treat the reply as a starting point.

COPY THIS PROMPT

```
List everything you remember about me: facts, preferences, people I've mentioned, and anything you learned from my connected apps. Group it by topic and say where each item came from (a chat, an app, or a file). Don't add guesses. Then tell me exactly where in your settings I can view, edit or delete each kind of memory.
```

THEN

Delete what you don't want it to keep, using the paths in this guide. For Claude, Settings → Memory lists every memory directly.
