THE FOLDER, THE PROMPTS, THE CHECKS

My reel studio in *one Claude Code folder*

How the folder is laid out, the exact lines I give Claude Code, the checks every reel passes before export, and what one reel really costs.

0 VIDEO CREDITS · RENDERS IN ABOUT 30 S

THE IDEA

Every graphic is *code*

Claude Code writes each scene as a small React component. **Remotion** draws it frame by frame on your laptop. No AI video model makes the picture, so there's nothing to pay per clip and you can fix any frame by changing a line.

- **Claude Code** writes and edits the code
- **Remotion** renders the video
- **ffmpeg** cuts, mixes and checks the sound
- **faster-whisper** times every word
- **yt-dlp** grabs reference reels to study

WHAT YOU NEED

A computer that runs Node.js and Python, Claude Code on a paid Claude plan, and an hour to set it up. A voice is optional: use your own recording or a voice tool.

SOURCES

1. Remotion `remotion.dev`
   renders React to video
2. Claude Code `code.claude.com`
   the agent that writes it
3. The reel the look came from (@thesocialalpha_) `instagram.com`

THE FOLDER

One folder *per job*

REFERENCES/	reels I study: the video + a written breakdown of colours, fonts, sizes and timing
MOTION-LIBRARY/	the Remotion project: every graphic, grouped into looks (kits)
SCRIPTS/	one folder per script, graded before I record
EDITS/	one folder per reel: raw, assets, transcript, storyboard, plan.json, renders
TOOLS/	small scripts: cut pauses, make the storyboard, mix, final check
CLAUDE.MD	the rules Claude Code reads first: the workflow, step by step

THE MOST IMPORTANT FILE

CLAUDE.md is where my taste lives. Every time I correct something, the fix goes in there, so I never correct it twice.

START YOURS

Paste this into Claude Code

1 Make the folder

IN AN EMPTY FOLDER, INSIDE CLAUDE CODE

```
Set up a reel studio in this folder. Make references/, motion-
library/ (a Remotion project for 1080x1920 at 30 fps), scripts/,
edits/ and tools/. Install Remotion, and check that ffmpeg and
Python work. Then write a CLAUDE.md that says: one folder per
edit, collect assets before designing, make a storyboard and wait
for my OK before the final render.
```

It will ask before it installs anything. Read what it plans first.

2 Teach it one look

GIVE IT A REEL YOU LIKE

```
Study references/<name>/source.mp4. Measure the background
colours, the font, the text sizes and positions, and how fast
things move in. Write it all in BREAKDOWN.md, then build those
graphics in motion-library and rebuild 3 frames of the reel
to compare.
```

Ask it to **measure**, not guess. My last one matched the font at 0.93 and the headline within 1 pixel.

EVERY DAY

The *four lines* I actually type

A NEW SCRIPT

Write the script for scripts/<slug>

PLAN THE VIDEO

Draft the needs for edits/<slug>

FROM SCRIPT TO REEL

Make the video for scripts/<slug>

AFTER I REVIEW IT

Apply my dashboard comments on edits/<slug>

WHY SO SHORT

The detail is in CLAUDE.md. A short line plus good rules beats a long prompt every time.

BEFORE EXPORT

The *checks* every reel passes

- **The script is graded first**: hook said in about 3 s, my own demo early, no filler words, the last line loops to the hook
- **Every pause over 0.12 s is cut**, found in the audio
- **A storyboard comes first**: one still per beat, and nothing final renders until I say OK
- **Words stay whole**: final_check re-listens to the export and fails if a cut clipped a word
- **Nothing covers a face**, and nothing sits in Instagram's top or bottom bars
- **Loudness at -14 LUFS**, measured on the exported file

The storyboard for this reel: 15 beats, one still each.

HONEST NUMBERS

What this reel *cost*

0 video-model credits	27 s to render the 36 s reel
910 voice credits (ElevenLabs)	

The voice is an **ElevenLabs library narrator**, not my own: 2 short tests plus the full read. With your own recorded voice, that line is 0 too. Claude Code runs on my Claude plan.

CREDIT

The look of this reel (pixel tiles, a big blue word, one card per line) was studied from a reel by **@thesocialalpha_**. The words and the studio are mine.

A frame from the finished reel: the code, then the frames it renders.

Now make your *first one*

Start with one look you love. Measure it, build it, then reuse it forever.

— Abhay
