EVERY PROMPT, WORD FOR WORD

One Ramayana scene in *five art styles*

How I turned Ram's vow from the Ramayana trailer into anime, a kathputli puppet, Madhubani, claymation and 16-bit pixel art, with Claude Opus 5.5 running Higgsfield.

5 SHOTS · 5 LOOKS · ABOUT 55 HIGGSFIELD CREDITS

BEFORE YOU START

What you *need*

- **Claude** with the **Higgsfield connector** switched on (claude.ai → + → Connectors). I used **Claude Opus 5.5**
- **A Higgsfield plan with credits** (higgsfield.ai). The connector spends your own credits
- **A 5–10 second scene with dialogue** from an official upload, like the studio's own trailer

HOW IT WORKS

Claude writes and sends every prompt. **Higgsfield's models do the drawing and the moving**: GPT Image 2.6 redraws the first frame of each shot, then Genjutsu Lite moves that drawing with the real shot's motion, so the head and mouth follow the actor.

The five looks, one per shot (AI-made with Higgsfield).

STEP 1

Pick the *scene*

- **One line people know.** I used Ram's vow, "Main apni Sita ko wapas launga" (2:53–3:03 of the trailer)
- **A scene with 4–6 cuts of about 2 seconds.** Each cut gets its own look, so the style changes on the film's own edit
- **Crop each cut to 9:16** and save its first frame as a picture
- **Keep it short and credit the studio** on screen and in your caption

1 Redraw a shot's first frame

COPY THIS PROMPT

```
Use the Higgsfield connector only, no browser. Redraw the
FIRST image exactly (same framing, same pose, same people and
positions) in the art style of the SECOND image: <your look>.
No text.
```

First image = the shot's first frame. Second image = a test still of the look you liked. "Connector only, no browser" stops Claude from opening the Higgsfield website instead.

THE SETTINGS I USED

GPT Image 2.6, 9:16, two reference images — 0.25 credits a still.

LOOKS 1 AND 2

Anime and *kathputli puppet*

COPY THIS PROMPT

1990s Japanese cel anime: clean ink outlines, flat cel shading, hand-painted anime background, dramatic rim light.

COPY THIS PROMPT

A Rajasthani kathputli string puppet: carved painted wooden puppet with big painted eyes, mirror-work cloth, visible puppet strings rising out of frame from the head and the raised arm, warm puppet-theatre light.

LOOKS 3, 4 AND 5

Madhubani, claymation and 16-bit pixel art

COPY THIS PROMPT

A traditional Madhubani folk painting: bold black outlines, flat red, ochre, green and indigo, background filled with fish, leaf and line patterns, double-line border, handmade paper.

COPY THIS PROMPT

An obvious stop-motion claymation figure. Everything is plasticine: chunky rounded clay face with visible fingerprints, a clay hair bun, rolled clay strips for the clothes, a hand-built miniature clay set. Matte clay, soft studio light. It must look like a handmade clay puppet, not a real person.

CLAYMATION NEEDED A SECOND TRY

My first claymation still looked like the real actor with a filter. Adding **"it must look like a handmade clay puppet, not a real person"** fixed it.

COPY THIS PROMPT

A 16-bit retro video game cutscene: chunky pixel art, limited palette, dithered shading, crisp hard pixels. No text, no HUD.

STEP 2

Make each look *move*

2 Move the drawing with the real shot

COPY THIS PROMPT

```
Use the Higgsfield connector only, no browser. Use Genjutsu Lite
at 720p. The image is <the styled still>, the driving video is
<the original shot>. The character performs exactly the motion,
head and mouth movement of the driving video, keeping the art
style of the image.
```

Clips shorter than 3 seconds get refused, so I froze the last frame to make each shot 3 s long and used only the real part.

WHAT DID NOT WORK

I tried restyling the clips directly with **Gemini Omni Flash (edit)** first. It refused all five shots, and Higgsfield gave the credits back. Grok Video with the line as audio failed too.

Genjutsu Lite copies the head and body, but not the lips. So one more step:

3 Fix the lips with HeyGen

COPY THIS PROMPT

```
In HeyGen, use Lipsync (precision mode). The video is the styled
shot with the trailer's own audio inside it; the audio is the
same line as a WAV.
```

HeyGen needs the speech inside the video too, and it takes WAV, not MP3. Then put the five shots back in the film's order, on the film's own cuts, with the trailer audio underneath.

HONEST NUMBERS

What it *cost* me

55
Higgsfield credits in total, tests and redos included

8
credits per moving shot (Genjutsu Lite)

4
HeyGen lip syncs, about 8 seconds in all

Claude Opus 5.5 is on Claude's paid plans; the free plan has Sonnet and Haiku. The Higgsfield connector works on the free plan, but the credits are always your own.

LINKS (CHECKED 11 NOV 2026)

1. Higgsfield `higgsfield.ai`
2. Claude plans `claude.com`
3. RAMAYANA – Official Trailer (Sony Pictures Entertainment) `youtube.com`

The trailer clip belongs to Sony Pictures Entertainment and is used here for commentary. All five looks are AI redraws.

Five looks, *one scene*

Every prompt here is the one I ran for the reel, word for word.
