THE EXACT PROMPTS, IN ORDER

How I make Claude *copy any* creator's editing style

The 5 prompts I use — from one reel you love to your own video, edited in that style.

6 STYLES SO FAR · EACH FROM ONE REEL

BEFORE YOU START

What you *need*

- **Claude Code** — the desktop app or the terminal, pointed at a folder for your videos (claude.com/claude-code)
- **ffmpeg** — free; Claude uses it to pull frames, cut and mix (ffmpeg.org)
- **Remotion** — renders the graphics from code; free for individuals (remotion.dev)
- **One reel** whose editing you love, saved as an .mp4
- **Your own clip** — a talking-head video is perfect to start

HOW IT WORKS

Claude doesn't "get inspired". It **measures** the reel — colours, fonts, sizes, timing — builds every graphic to those numbers, checks its copy against the original, then edits your video with it.

THE 5 PROMPTS

1 **Study the reel** — measure everything

2 **Build the pieces** — to those numbers, then compare

3 **Match the colour grade** — a LUT for your footage

4 **Edit your video** — in the new style

5 **Check before you post** — frames and loudness

PROMPT 1 OF 5

Study the reel

COPY THIS PROMPT

```
Here's a reel I love: reel.mp4. Study its editing style
thoroughly — measure it, don't eyeball it.
1. Pull 3 frames a second and make contact sheets so you can see
every beat.
2. Sample the exact colours (hex) of the text, boxes
and backgrounds.
3. Measure every text element from the pixels: size, position,
alignment, letter spacing.
4. Identify the fonts: crop a word, render 5–10 candidate fonts
at the same size and score how well each overlaps the crop. Pick
by the score, not by eye.
5. Time every animation and transition frame by frame: how long,
which easing, what moves.
Write it all up as STYLE.md with tables of real numbers.
```

WHAT YOU GET BACK — MEASURED ON ONE REEL

FONTS	Instrument Serif for titles and captions (0.76 overlap score), a mono for labels
COLOURS	cream `#F5EEE1` on dark, green `#1C351F` on light, caption box `#233E2C`
CAPTIONS	67 px, box at y 1318–1400; each word lights up as it's said
TITLES	every line sized to one width; letters rise in 3–4 frames
TRANSITIONS	camera-blur whips: 0.1 s in, 0.13 s hold, 0.12 s out
GRADE	olive shadows, warm mids, cream highlights — no blue anywhere

From @justyn.ai's reel "three different editing styles" — the style is his.

2 Build the pieces to those numbers

COPY THIS PROMPT

```
Build each graphic in STYLE.md as a reusable Remotion component — titles, captions, cards, transitions — using the measured fonts, colours, sizes and timings. Then rebuild 3–4 frames of the original reel and put them next to the real frames. Measure the difference and fix anything more than a few pixels off. Keep going until they match.
```

The step most people skip — and why the copy looks like the original.

3 Match the colour grade

COPY THIS PROMPT

```
Measure the reel's colour grade from the footage only, not the graphics: black and white points, the tone curve, the tint of the shadows, mids and highlights, the saturation, and which hues it uses. Make a LUT that moves my clip me.mp4 onto that look. Keep skin natural — if my face ends up darker than in the reel, lift it. Show me before / after / the original side by side.
```

If the reel's room is much brighter or darker than yours, ask for the grade at half strength.

Before → after → the original reel (@justyn.ai).

4 Edit your video in the style

COPY THIS PROMPT

```
Now edit me.mp4 in this style. Transcribe it, cut every pause
longer than 0.12 s, and lay out the edit: every graphic comes in
on the word that names it, one graphic at a time. Grade it with
the LUT, add captions in the style, a quiet music bed and small
sound hits, and mix to −14 LUFS. Render a half-size draft first
and show me a frame every 2 seconds.
```

Left: the original by @justyn.ai. Right: my video, edited by Claude in his style.

5 Check before you post

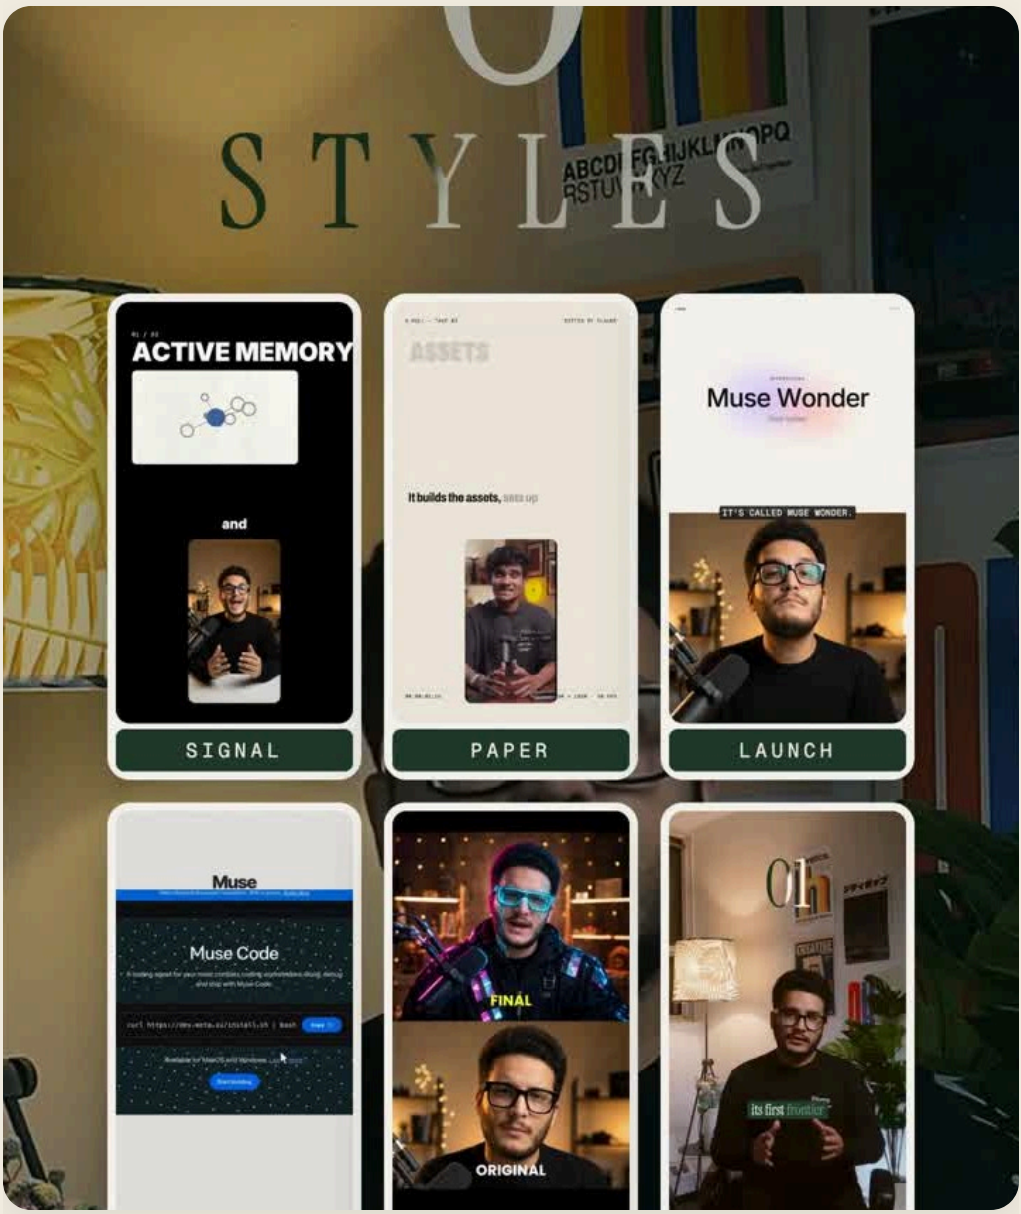

COPY THIS PROMPT

```
Before I post: make a contact sheet with one frame every 2
seconds, list anything that pops in or vanishes in a single
frame, check the loudness, and fix what's off. Then render the
final in 4K.
```

MAKE IT LAST

Save the style

- **One reel is enough** — if the study is in numbers, not vibes.
- **Save each style** in your folder (the components + STYLE.md). Your next video only needs prompt 4.
- **Credit the original creator** on screen and in your caption whenever you show their reel.
- **Your room changes the look.** If your footage won't fully match the grade, go halfway and let the graphics do the work.

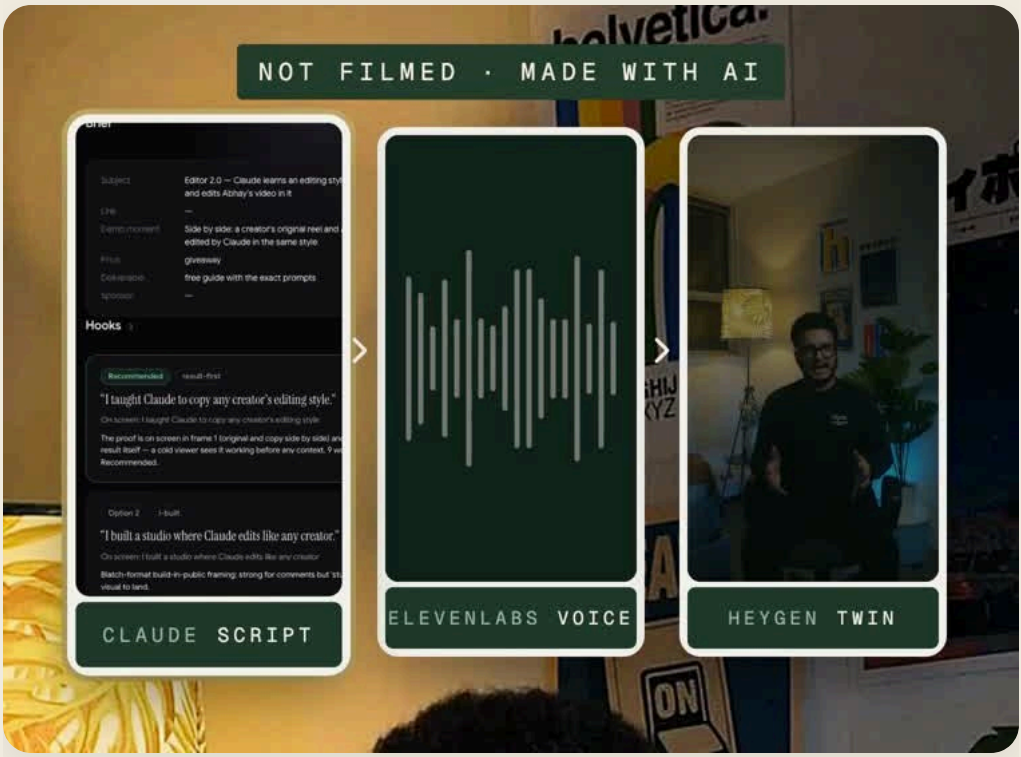

Six styles so far — each one learned from a single reel.

BONUS

How I *didn't film* this reel

SCRIPT	Claude wrote it from a short brief and checked it against what works on my own Instagram
VOICE	my ElevenLabs voice clone read the script
VIDEO	my HeyGen AI twin (Avatar III — it keeps my real recorded footage, so it stays sharp)
EDIT	Claude, in the style from prompt 1 — graded, captioned, mixed and exported in 4K

Everything AI-made is shown as AI-made. Clone only your own voice and face.

Script by Claude, voice by ElevenLabs, video by my HeyGen twin.

Now copy *your favourite*

One reel you love is all it takes.
